

Testing Objectives

The primary objective of this usability testing study was to evaluate the ease of use, navigation, and overall user experience of the Student Task Management App prototype. The testing aimed to identify usability issues, gather user feedback, and understand how effectively users could complete common tasks within the application.

Specific objectives included:

- Assessing the clarity and intuitiveness of the user interface.
- Evaluating how easily users can navigate between different screens.
- Observing users while performing key tasks such as viewing tasks, checking progress, and accessing task details.
- Identifying any difficulties, confusion, or usability challenges faced by users.
- Collecting feedback on the visual design, layout, and overall user satisfaction.
- Gathering suggestions for improving the application's functionality and user experience.
- Understanding how the design supports task management and productivity for students.

This testing was conducted to ensure that the application meets user needs and provides an efficient, user-friendly experience while highlighting areas for future improvement.

FEEDBACK

Sowmya

The app felt very clean and easy to use from the beginning. I especially liked how organized the dashboard looked because I could immediately see what tasks were pending. The color scheme was pleasant and not distracting. One thing I noticed was that the task status labels could stand out more so users can quickly identify important tasks without reading everything.

Ravi

I found the navigation straightforward and didn't need any help moving between the screens. The design felt modern and simple, which made the app comfortable to use. However, when viewing tasks, I wanted to see more information such as task priority or estimated completion time. Adding those details could make planning easier.

Dheeraj

The login and onboarding process was smooth and easy to understand. I liked that the interface wasn't cluttered with too many elements. The progress section was useful, but the progress indicators looked a little small on the screen. Making them larger or more visually prominent would improve the experience.

Poojitha

The overall design looked professional and student-friendly. I liked the consistent use of colors and icons throughout the application. While completing the testing tasks, I felt that adding notifications or reminders for approaching deadlines would make the app more useful for daily academic planning.

Haritha

I enjoyed using the prototype because everything felt simple and intuitive. The illustrations and soft color palette made the app feel welcoming. One suggestion I have is to provide a clearer distinction between completed and pending tasks, perhaps using stronger colors or visual indicators. This would help users understand their progress more quickly.

Overall Summary

Common Positive Feedback

- Clean and minimal interface
- Easy navigation
- Consistent color theme
- User-friendly layout

Common Suggestions

- Improve task status visibility
- Add task priority information
- Increase size of progress indicators
- Add deadline reminders/notifications
- Make completed and pending tasks easier to distinguish

Analysis

- Average Rating: **4.4 / 5**
- 2 users rated the app **5/5**
- 3 users rated the app **4/5**
- No user rated below 4, indicating a positive overall experience.

The usability testing results indicate a high level of user satisfaction. Participants found the application easy to navigate, visually appealing, and intuitive to use. The average satisfaction rating of 4.4/5 suggests that the prototype effectively meets user expectations while highlighting opportunities for minor improvements such as enhanced task visibility and larger progress indicators.

Overall Output

This usability testing activity helped in understanding the importance of usability metrics, testing methods, and iterative design improvement in the UX design process. Usability metrics such as task completion rate, efficiency, error rate, and user satisfaction were used to evaluate the effectiveness of the prototype. Testing methods including user observation, task-based testing, and feedback collection provided valuable insights into how users interact with the application. Based on the feedback received, potential design improvements were identified to enhance the overall user experience. This process demonstrated the value of iterative design, where user feedback is continuously incorporated to refine and improve a product over time.

This exercise strengthened the understanding of user-centered design principles and highlighted the importance of designing solutions that are both functional and easy to use.

Thank you
